

HOW TO BREED HIGH VALUE BEEF CALVES FROM THE DAIRY HERD

1. Decide which breed you wish to use
2. Use the panels below to select the appropriate sires for your Maidens, 2nd Calvers, Cows & Mature Cows
3. Then select the highest Carcass Weight & Beef Sub Index within your calving range
4. Record the sire of the calf at birth -otherwise the CBV will not be available

DAIRY BEEF INDEX – WHAT’S INCLUDED?

~40% CALVING TRAITS 60% BEEF TRAITS

Trait	Sub-Index	Relative Emphasis
Calving Difficulty	Calving SI	27%
Gestation	Calving SI	11%
Mortality	Calving SI	1%
Feed Intake	Beef SI	10%
Age at slaughter	Beef SI	6%
Carcass Weight	Beef SI	25%
Carcass Conformation	Beef SI	3%
In -spec	Beef SI	10%
Gestation	Carbon SI	2%
Age at slaughter	Carbon SI	3%
Carcass Weight	Carbon SI	2%

COMMERCIAL BEEF VALUE (CBV)

A TOOL TO ESTABLISH THE BEEF MERIT OF CALVES AND CONSEQUENTLY THEIR VALUE

CBV = DBI minus CALVING TRAITS
90% Beef Sub-Index
10% Carbon Sub-Index

The CBV is a value that is available for all cattle that are likely to be finished as beef cattle.

Cattle that have a high CBV will, on average, be faster growing, grade better at slaughter, meet market specifications at a younger age and will not eat as much per kg liveweight gained. Consequently, they are more profitable. Cattle that have a low CBV will, on average, be poor for many of these traits and therefore less likely to be profitable.

High CBV cattle are therefore worth more than low CBV cattle. Knowing whether animals are high or low for CBV allows the buyer to make a much more informed decision about how much should be paid for each.
