SYMBOLS EXPLAINED

For each breed, the superior sires for weanling production, finishing and replacements are clearly labelled. These labels are our stamp of approval.

The superior sires for weanling production are the sires that will deliver the highest value weanlings. Progeny of these sires have excellent weight and muscle development at the weaning stage. The sires recommended for weanling production in this catalogue rank highly for weaning weight and calf quality, at high reliabilities. They consistently produce numerous champions and top prices at weanling shows and sales around the country.

The superior sires for finishing are the sires which will efficiently produce heavy, high grade, high value carcasses. The sires recommended for finishing in this catalogue rank highly for carcass weight and carcass conformation at high reliabilities

A pedigree royalty fee applies to these sires at the time of registration of pedigree progeny. This is collected by the relevant breed society. No fee applies to commercial calves.

The superior sires for replacements are those which will deliver solid, hard-working cows. Daughters have good milk, fertility, calving ability, temperament, are easily maintained and are functionally correct in order to last the long winters inside. The sires recommended in this catalogue for replacement are well proven.

These are bulls which are awaiting a calving survey

PROGRESSIVE ATAXIA: NON CARRIER

- An excellent quality well-bred bull with a low reliability index as it is a new bloodline
- Use him and you will not be disappointed - he comes from superior proven French AI sires and had an excellent performance test
- His French genomics predict that he will be an all-rounder excelling in both maternal and terminal traits with average calving

SCAN ME FOR
LATEST INDEX

- No. 1 proven HE available on DBI
- Profile is the ultimate HE sire; calving easy, short gestation, super quality, colour & homo-polled
- He ranks in the top 1% of the breed for Terminal Index and DBI

MAXIMISE SUCCESS OF AI IN SUCKLER COWS

1. The cow must have an easy calving.

Match your cows to sires that they are capable of calving easily. Difficult calving is one of the biggest causes of cows being slow to return to service. Heifers that are calving at 2 years of age need an exceptionally easy calving sire.

2. Break the strong maternal- offspring bond

Cows must cycle within 55 days of calving to achieve one calf per cow per year. Breaking the maternal bond will reduce the time to first heat by 4 weeks. 80% of cows will exhibit a fertile heat by day 45, however, about 10% will not respond. These are often the cows in poor Body Condition Score (BCS).

The easiest way to break the bond is to separate the calves from the cows from day 30, only allowing access for twice daily suckling. This is a superb way of getting Autumn calvers and 1st calvers cycling. For the autumn calving cows indoors, a door in the creep area to an outside paddock can be opened to allow the calves out to grass.

In addition to the cows cycling sooner, the calves are out most of the time resulting in reduced disease issues, less bedding used and heavier calves at weaning. A winner all around.

3. Nutrition and BCS at calving

The higher the BCS at calving the quicker the cow will resume cycling post - calving. A BCS of 2.5+ is ideal.

Extra feeding after calving will not compensate for poor BCS at calving; good nutrition is necessary pre and post calving. Cows on poor BCS e.g. 1.75 will not cycle until 71+ days after calving while cows in good BCS 3.0+ will be cycling by day 55.

Avoid fluctuations in feed supply around breeding. Keep cows on a rising plane of nutrition.

Mineral supplementation is necessary to supplement the silage ingested

4. Health

Discuss a herd health strategy with your Vet pre-breeding.

Ensure cows receive all vaccinations 3 weeks prior to breeding. Ensure cows are dosed for parasites if necessary - Fluke & Worms prior to breeding.

5. Avoid stress around the time of breeding

Ensure cows are in a socially stable group. Avoid mixing cows from different groups during the breeding season especially 1st calved heifers.

6. Requirements for cows to express normal heat activity

Adequate space is necessary to allow mounting for heat detection. Increased stocking density indoors reduces heat expression and more false heats will occur.

Mounting activity and duration of mounting is reduced where under foot conditions are slippery and when cattle are on concrete.

7. Timing of insemination to maximise conception rates

The best time to inseminate is when animals are in standing heat and up to 12 hours after the end of standing heat.

Avoid inseminating cows that are more than 12 hours after the end of standing heat.

Heat detection aids are crucial for accurate and efficient heat detection.

Once a day insemination works well. For example, if the technician is coming into your yard each day at 12 noon, inseminate all the cows you have seen up to 12 noon that day.

Speak to your technician and discuss your routine.

When synchronising cows and heifers, plan the time of insemination in advance with your technician and strictly adhere to the programme.

Insemination is a job requiring precision to maximise conception rate.

Ensure adequate facilities are available and help the technician especially where more than one animal is to be inseminated.

8. Biosecurity - it's everybody's responsibility!

MAXIMISE SUCCESS OF AI IN MAIDEN HEIFERS

1. Ensure that heifers meet the recommended target weights at breeding.

- This ensures that the majority of heifers are cycling
- This ensures that heifers are well developed at calving and will calve easily.
- This ensures that heifers are more likely to go in-calf within 60-80 days after their 1st calving.

2. Ensure that heifers are on a rising plane of nutrition (gaining weight) 3 weeks before and during the breeding season.

3. Ensure that heifers have received all of their vaccines 3 weeks prior to breeding.

4. Ensure that heifers have been dosed for parasites- Fluke & Worms prior to breeding.

5. Ensure that heifers are in a socially stable group; avoid mixing heifers from different groups during the breeding season.

6. Ensure that heifers have adequate space to allow mounting for heat detection. Increased stocking density indoors reduces heat expression and more false heats will occur.

7. Ensure that heifers have suitable under-foot conditions; mounting activity and duration of mounting is reduced when under- foot conditions are slippery and when cattle are on concrete.

Recommended target weight at 14 months of age		
Breed Target	Target (KG)	ADG birth to 14 months (Kg/day)
Angus X	370	0.77
Hereford X	370	0.77
Simmental X	400	0.85
Limousin X	420	0.88
Charolais X	430	0.9

HEAT DETECTION AIDS

PAINT STICKS/ CRAYONS

Paint sticks or crayons are very easy and convenient to use. They rub off easily after mounting and they work well with cattle indoors and outdoors.

VASECTOMISED BULL

Vasectomised bulls fitted with chin balls are an excellent method of heat detection for both heifers and cows. The chin ball is as important as the bull as heats will be missed due to the bull mating the cow and not remaining with her. This happens especially in mature bulls as they mate and walk away. They do less courting than young bulls. Ensure the bull is vasectomised. Your Vet can check the ejaculate to ensure it is free of semen

SCRATCH CARDS

Scratch cards are an excellent method of heat detection in both cows and heifers when cattle are outdoors and rumps are clean. The scratch cards shown here in the picture are excellent; they stay on the females are not very easily scratched off making it easier to identify the animal on heat.

Before

After animal has shown signs of standing heat

Top Tips

1. Watch the forecast for a perfectly dry day to apply the cards.
2. Patience- Wait till the 1st card is tacky before application. It will stick to your glove when tacky.
3. Reapply the cards the day after being inseminated.

HEALTH & SAFETY

Exercise caution when dealing with all bulls including those that are vasectomised.

BENEFITS OF SYNCHRONISATION

1. All animal inseminated on the one day without any heat detection.
2. Repeats will occur over a 2-4 day period, making heat detection much easier as more animals are on heat at the one time. You will know the expected days of heats in advance.
3. Cows calved 35 days and not cycling when synchronised will resume cyclicity, provided nutrition and management is good. This will increase the 3 and 6 week calving rate.
4. A compact group of cows/heifers can be presented for scanning and the empty cows/heifers can be synchronised again or marked for heat detection.
5. A compact calf crop makes management from calving to weaning easier and facilitates sale.
6. Compacting calving allows animals to be grouped together e.g. all 1st calvers can be grouped together for extra feeding.
7. Even though you will inseminate animals in one day, they will calve over a two-week period.

Note: When heats are due in a group of cows indoors, it is best to lock the calves away from the cows in the creep area to avoid them getting injured. It is also prudent to take away the vasectomised bull at this time of maximum activity to avoid him getting injured.

DIY TRAINING COURSE

Would you like to AI your own cows?

We offer Ireland's most comprehensive DIY AI course with unrivalled theory and practical training.

**DAFM APPROVED
5 DAY COARSE.**

SYNCHRONISATION PROGRAMMES FOR BEEF COWS AND HEIFERS

Fixed Time AI protocol for Beef cows – No heat detection. 3 Handlings in the crush

Example Day	Example Time	Day	Action
Mon 3rd April	Anytime	Day 0	Insert P4 device + Inject GnRH
Mon 10th April	3pm	Day 7	Remove P4 device + Inject PG + Inject 200 iu eCG
Thurs 13th April	2pm - 4pm	Day 10	FTAI + Inject GnRH

- This is a superb programme for herds that wish to tighten and advance the mean calving date & maximises pregnancy rates as 100% submission is achieved.
- Superb to bring forward late calvers, however ensure cows are calved 35 days, have a BCS of 2.75+ and Intakes are maximised.

Fixed Time AI protocol for Beef Heifers

Example Day	Example Time	Day	Action
Mon 3rd April	Anytime	Day 0	Insert P4 device + Inject GnRH
Sat 8th April	3pm	Day 5	Inject PG
Sun 9th April	3pm	Day 6	Remove P4 device + Inject PG
Tue 11rd April	2 - 4pm	Day 8	FTAI conventional semen + Inject GnRH

- This regime allows you to inseminate all heifers with 4 handlings and all are AI'ed at a fixed time - No heat detection until the repeats.
- AI'ing the repeats ensures that the bulls are not overworked, avoids bulls getting injured and ensures we will have them when we need them

PG Injection on Day 7 – Heat Detect

Example Days	Day	Action
Mon 3rd to Mon 10 th of April	Day 0 – Day 7	AI on observed heat - should have 1/3 detected at end of week
Mon 10th April	Day 7	PG to heifers not detected in heat. Only inject if 1/3 bred already - otherwise investigate. Continue to heat detect
Wed 12 th /Thur 13 th April	Day 9 – Day 10	AI on detected heat. Majority on 48-72 hours post PG injection

- If 1/3 are not bred in the 1st week avoid injecting with PG as the heifers are not cycling- due to their weight, plane of nutrition, pregnancy or heat detection.
- For those that are not observed - reinject PG 11 days after the 1st injection.
- If releasing a bull after AI, watch carefully for the repeats to ensure he is not overworked in those 2-4 days - prudent to use AI for those 2-4 days.

Table of Hormones required, route of application and example products:

Code	Hormone	Route	Example
P4 Device	Progesterone releasing device	Intra uterine	PRID, CIDR
GnRH	Gonadotrophin releasing hormone	Intramuscular	Receptal, Overelin, Acegon, Busol
PG	Prostaglandin	Intramuscular	Estrumate, Lutalyse, Enzaprost
eCG	Equine chorionic Gonadotrophin	Intramuscular	Folligon, Synchronstim.

Products containing the above hormones are prescription only medicines and must be prescribed by your veterinary surgeon

- The P4 Device needs to be inserted hygienically. Failure to do this will lead to excessive vaginal discharge and reduced conception rates.
- It is advisable to shorten the strings of the PRID/ CIDR particularly in heifers, as a rogue heifer may pull out several devices.
- Always contact your technician/breeding advisor prior to starting any programme to ensure availability of technician(s) on the day for fixed time AI.
- Inadvertent administration of prostaglandin to a cow/ heifer during the first 3-4 months of pregnancy will cause abortion.

Right Task, Right Time

FarmOps has been **DEVELOPED BY OUR VETS** and **RECOMMENDS THE RIGHT TASK AT THE RIGHT TIME** for Suckler farmers who want to see real progress.

Let FarmOps help you manage your breeding season

When your breeding season starts you will get daily insights on your progress and targets as to where you should be. Each day the following 6 parameters will be updated.

1. Expected in Heat

We will estimate the number of cows & heifers that should be in heat today.

This will help flag to you if you have a problem with cows not cycling or heat observation very early.

4. Not served

We will show you the cows and heifers that are eligible to be served (calved over 35 days) and that are not yet served.

This will help identify animals with problems easily.

2. Due for Repeat

We will show you the number of cows & heifers that could repeat today.

These are the animals to keep a close watch on in case of repeat.

5. Potentially Empty

We will calculate each day the number of cows & heifers that are likely to be empty in the herd.

This will help you by giving you a view as to how the breeding season is progressing.

3. Valid Serves

We will count all your serves each day and check how many are valid (e.g. we will exclude 1 day repeats). This can be compared then against the target number of serves set daily for your herd.

This will help you see how the breeding season is progressing for you. If you are not hitting the targets, there may be an investigation required.

6. Stock bulls Required

We will show you how many mature fertile stock bulls that would be required to serve the potentially empty animals in the herd.

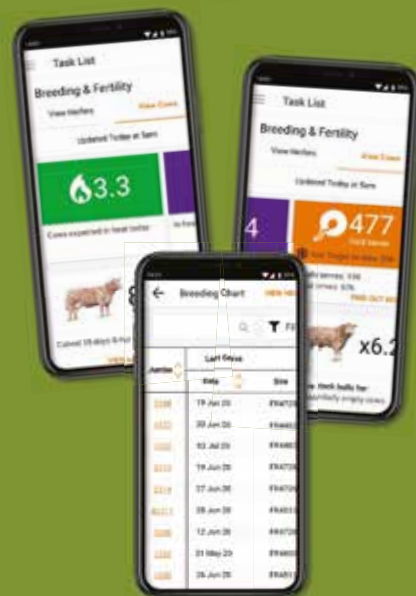

MAKE BETTER MORE INFORMED BREEDING DECISIONS WITH FARMOPS

- Don't forget you can record your DIY AI serves and stock bull serves using FarmOps.
- Use FarmOps to record any serves or scanning details not saved already.
- Did you know you can register your calves with FarmOps?
