# NCBC Beef Breeding Programme

The largest of its kind in Ireland, the **NCBC beef breeding program** focuses on delivering high-performance beef bulls for both **Terminal** (breeding weanlings and finished cattle) and **Maternal** (breeding suckler herd replacements) purposes

## SYMBOLS EXPLAINED

For each breed, the superior sires for weanling production, finishing and replacements are clearly labelled. These labels are our stamp of approval.

**WEANLING**

The superior sires for weanling production are the sires that will deliver the highest value weanlings. Progeny of these sires have excellent weight and muscle development at the weaning stage. The sires recommended for weanling production in this catalogue rank highly for weaning weight and calf quality. They consistently produce numerous champions and top prices at weanling shows and sales around the country.

**FINISHING**

The superior sires for finishing are the sires which will efficiently produce heavy, high grade, high value carcasses. The sires recommended for finishing in this catalogue rank highly for carcass weight and carcass conformation.

**REPLACEMENT**

The superior sires for replacements are those which will deliver solid, hard-working cows. Daughters have good milk, fertility, calving ability, temperament, are easily maintained and are functionally correct in order to last the long winters inside.

**PEDIGREE ROYALTY**

A pedigree royalty fee applies to these sires at the time of registration of pedigree progeny. This is collected by the relevant breed society. No fee applies to commercial calves.

**PROOF PENDING**

These are bulls which are awaiting a calving survey

**SCEP SCHEME**

Bulls with the above SCEP label are eligible for Action 1 for calves born up to 30th of June 2027.

These sires contain Intellectual Property rights connected to NCBC's breeding programmes. This relates to the sale of semen, embryos and offspring from these sires to other AI companies. For further information, please refer to our T's & C's.

# SUPPORTING SUCKLER FARMERS EVERY STEP OF THE WAY!

“ It is brilliant to see which animals and which breeds are performing best from a weight gain point of view and even more importantly I can see where I bought these stock, so I know where and who to buy from going forward.

Overall we are delighted with FarmOps. We have a much better grasp of how our stock is performing and are more confident in the killouts we will achieve when selecting animals for the factory. ”

- John McGrath, Co. Limerick

## BEEF HERD SUBSCRIPTION

**Yearly: €183.27 inc. Vat @23%**

### WHAT'S INCLUDED?

- |  |  |
|--|--|
| ✓ Record Weights – Track Daily Gains   | ✓ Bord Bia Compliance                            |
| ✓ View Slaughter Data                  | ✓ Remedies, Feeds & Sprays                       |
| ✓ Calf Registration & Animal Movements | ✓ Breeding Data – Record Serves, Scans and Heats |

## PEDIGREE BREEDERS

Tailored Calf Registration with animal pedigree and Euro-Star data.

Register calves, send pedigree names to all breed societies and record calf weights and size.

Genotype included in evaluation

Sire, Herberry 1 Herbet ET

- Watson's 1st crop of calves are truly exceptional; long, well-muscled, correct, stylish & well-coloured
- HE trait leader for Age at finish, Gestation length, Docility, Milk
- Excellent sire, 5 star HE for both Replacement, Terminal Index & Dairy Beef
- Homozygous Polled sire, 100% his progeny will have no horns
- Excellent sire, 5 star for both Replacement and Terminal Index within the HE breed

# MAXIMISE SUCCESS OF AI IN SUCKLER COWS

## 1. The cow must have an easy calving.

Match your cows to sires that they are capable of calving easily. Difficult calving is one of the biggest causes of cows being slow to return to service. Heifers that are calving at 2 years of age need an exceptionally easy calving sire.

## 2. Break the strong maternal- offspring bond

Cows must cycle within 55 days of calving to achieve one calf per cow per year. Breaking the maternal bond will reduce the time to first heat by 4 weeks. 80% of cows will exhibit a fertile heat by day 45, however, about 10% will not respond. These are often the cows in poor Body Condition Score (BCS).

The easiest way to break the bond is to separate the calves from the cows from day 30, only allowing access for twice daily suckling. This is a superb way of getting Autumn calvers and 1st calvers cycling. For the autumn calving cows indoors, a door in the creep area to an outside paddock can be opened to allow the calves out to grass.

In addition to the cows cycling sooner, the calves are out most of the time resulting in reduced disease issues, less bedding used and heavier calves at weaning. A winner all around.

## 3. Nutrition and BCS at calving

The higher the BCS at calving the quicker the cow will resume cycling post - calving. A BCS of 2.5+ is ideal.

Extra feeding after calving will not compensate for poor BCS at calving; good nutrition is necessary pre and post calving. Cows on poor BCS e.g. 1.75 will not cycle until 71+ days after calving while cows in good BCS 3.0+ will be cycling by day 55.

Avoid fluctuations in feed supply around breeding. Keep cows on a rising plane of nutrition.

Mineral supplementation is necessary to supplement the silage ingested

## 4. Health

Discuss a herd health strategy with your Vet pre-breeding.

Ensure cows receive all vaccinations 3 weeks prior to breeding. Ensure cows are dosed for parasites if necessary Fluke & Worms prior to breeding.

## 5. Avoid stress around the time of breeding

Ensure cows are in a socially stable group. Avoid mixing cows from different groups during the breeding season especially 1<sup>st</sup> calved heifers.

## 6. Requirements for cows to express normal heat activity

Adequate space is necessary to allow mounting for heat detection. Increased stocking density indoors reduces heat expression and more false heats will occur.

Mounting activity and duration of mounting is reduced where under foot conditions are slippery and when cattle are on concrete.

## 7. Timing of insemination to maximise conception rates

The best time to inseminate is when animals are in standing heat and up to 12 hours after the end of standing heat.

Avoid inseminating cows that are more than 12 hours after the end of standing heat.

Heat detection aids are crucial for accurate and efficient heat detection.

Once a day insemination works well. For example, if the technician is coming into your yard each day at 12 noon, inseminate all the cows you have seen in standing heat in the prior 24 hours.

Speak to your technician and discuss your routine.

When synchronising cows and heifers, plan the time of insemination in advance with your technician and strictly adhere to the programme.

Insemination is a job requiring precision to maximise conception rate.

Ensure adequate facilities are available and help the technician especially where more than one animal is to be inseminated.

## 8. Biosecurity - it's everybody's responsibility!

# MAXIMISE SUCCESS OF AI IN MAIDEN HEIFERS

### 1. Ensure that heifers meet the recommended target weights at breeding.

- This ensures that the majority of heifers are cycling
- This ensures that heifers are well developed at calving and will calve easily.
- This ensures that heifers are more likely to go in-calf within 60-80 days after their 1st calving.

### 2. Ensure that heifers are on a rising plane of nutrition (gaining weight) 3 weeks before and during the breeding season.

### 3. Ensure that heifers have received all of their vaccines 3 weeks prior to breeding.

### 4. Ensure that heifers have been dosed for parasites- Fluke & Worms prior to breeding.

### 5. Ensure that heifers are in a socially stable group; avoid mixing heifers from different groups during the breeding season.

### 6. Ensure that heifers have adequate space to allow mounting for heat detection. Increased stocking density indoors reduces heat expression and more false heats will occur.

### 7. Ensure that heifers have suitable under-foot conditions; mounting activity and duration of mounting is reduced when under- foot conditions are slippery and when cattle are on concrete.

## Recommended target weight at 14 months of age

| Breed Target | Target (KG) | ADG birth to 14 months (Kg/day) |
|--------------|-------------|---------------------------------|
| Angus X      | 370         | 0.77                            |
| Hereford X   | 370         | 0.77                            |
| Simmental X  | 400         | 0.85                            |
| Limousin X   | 420         | 0.88                            |
| Charolais X  | 430         | 0.9                             |

## HEAT DETECTION AIDS

### PAINT STICKS/ CRAYONS

Paint sticks or crayons are very easy and convenient to use. They rub off easily after mounting and they work well with cattle indoors and outdoors.

**PAINTSTICKS**  
(12 per box)

**€40**

### VASECTOMISED BULL

Vasectomised bulls fitted with chin balls are an excellent method of heat detection for both heifers and cows. The chin ball is as important as the bull as heats will be missed due to the bull mating the cow and not remaining with her. This happens especially in mature bulls as they mate and walk away. They do less courting than young bulls. Ensure the bull is vasectomised. Your Vet can check the ejaculate to ensure it is free of semen

**CHINBALL HARNESS**  
(for vasectomised bull)

**€200**

**5L PAINT FOR HARNESS**

**€80**

### SCRATCH CARDS

Scratch cards are an excellent method of heat detection in both cows and heifers when cattle are outdoors and rumps are clean. The scratch cards shown here in the picture are excellent; they stay on the females are not very easily scratched off making it easier to identify the animal on heat.

**GLUE**

**€30**

**ROLL OF 100 E-ALERT PATCHES**

**€60**

Before

After animal has shown signs of standing heat

## Top Tips

1. Watch the forecast for a perfectly dry day to apply the cards.
2. Patience- Wait till the 1st card is tacky before application. It will stick to your glove when tacky.
3. Reapply the cards the day after being inseminated.

### HEALTH & SAFETY

Exercise caution when dealing with all bulls including those that are vasectomised.

# DIY Training Course

Would you like to AI your own cows?

We offer Ireland's most comprehensive DIY AI course with unrivalled theory and practical training.

DAFM APPROVED  
4 DAY COURSE

## BENEFITS OF SYNCHRONISATION

1. With fixed time AI, animal inseminated on the one day without any heat detection.
2. Repeats will occur over a 4-6 day period, making heat detection much easier as more animals are on heat at the one time. You will know the expected days of heats in advance.
3. Cows calved 35 days and not cycling when synchronised will resume cyclicity, provided nutrition and management is good. This will increase the 3 and 6 week calving rate.

## SYNCHRONISATION PROGRAMMES FOR BEEF COWS AND HEIFERS

### Fixed Time AI protocol for Beef cows - Conventional Semen – No heat detection. 3 Handlings in the crush

| Example Day      | Example Time | Day    | Action   |
|------------------|--------------|--------|--|
| Mon 3rd April    | Anytime      | Day 0  | Insert P4 device + Inject GnRH                   |
| Mon 10th April   | 3pm          | Day 7  | Remove P4 device + Inject PG + Inject 200 iu eCG |
| Thurs 13th April | 2pm - 3pm    | Day 10 | FTAI + Inject GnRH                               |

- For best results ensure cows are calved greater than 50 day at AI, are in good body condition, have a clean healthy uterus, are free from any health issues, are cycling regularly and are fully fed.
- Be aware that all repeats will come in between 18 and 24 days. Depending on numbers, the best approach is to apply heat detection aids and AI repeats to ensure no heats are missed and stock bulls are not over worked.
- Some cows may have a standing heat early on day 9. These cows can be inseminated on the evening of day 9 if identified.
- **If sexed semen is being used**, apply heat detection aids on day 7 and only use sexed semen on cows that have the aid fully rubbed off early on day 10.
- Warning – Ensure no more than 200iu units of eCG are administered. Overdosing can result in an increased rate of twinning and triplets.

# SYNCHRONISATION PROGRAMMES FOR BEEF COWS AND HEIFERS

## Fixed Time AI protocol for Beef Heifers - Conventional Semen

| Example Day    | Example Time | Day   | Action                                |
|----------------|--------------|-------|---------------------------------------|
| Mon 3rd April  | Anytime      | Day 0 | Insert P4 device + Inject GnRH        |
| Sat 8th April  | 3pm          | Day 5 | Inject PG                             |
| Sun 9th April  | 3pm          | Day 6 | Remove P4 device + Inject PG          |
| Tue 11rd April | 2-4pm        | Day 8 | FTAI conventional semen + Inject GnRH |

- Ensure heifers are at or above target weight, cycling regularly and on a rising plain of nutrition.
- Be aware that all repeats will come in between 18 and 24 days. Depending on numbers, the best approach is to apply scratch cards and AI repeats to ensure no heats are missed and stock bulls are not over worked.

## FTAI Protocol for Beef Heifers - Sexed Semen

| Example Day    | Example Time | Day   | Action                                       |
|----------------|--------------|-------|--|
| Mon 7th April  | Anytime      | Day 0 | Insert P4 device + Inject GnRH               |
| Sat 12th April | 9am          | Day 5 | Inject PG                                    |
| Sun 13th April | 9am          | Day 6 | Remove P4 device + Inject PG                 |
| Tue 15th April | 9am          | Day 8 | Inject GnRH (48 hrs after P4 device removal) |
|                | 4pm to 6pm   |       | FTAI sexed semen (8 hours post GnRH)         |

- Ensure heifers are at or above target weight, cycling regularly and on a rising plain of nutrition.
- Be aware that all repeats will come in between 18 and 24 days. Depending on numbers, the best approach is to apply scratch cards and AI repeats to ensure no heats are missed and stock bulls are not over worked.

## PG Injection on Day 7 - Heat Detect

| Example Days                                      | Day            | Action   |
|---|----------------|--|
| Mon 3rd to Mon 10 <sup>th</sup> of April          | Day 0 – Day 7  | AI on observed heat - should have 1/3 detected at end of week  |
| Mon 10th April                                    | Day 7          | PG to heifers not detected in heat. Only inject if 1/3 bred already - otherwise investigate. Continue to heat detect |
| Wed 12 <sup>th</sup> /Thur 13 <sup>th</sup> April | Day 9 – Day 10 | AI on detected heat. Majority on 48-72 hours post PG injection   |

- If 1/3 are not bred in the 1st week avoid injecting with PG as the heifers are not cycling- due to their weight, plane of nutrition, pregnancy or heat detection.
- If releasing a bull after AI, watch carefully for the repeats to ensure he is not overworked in those 2-4 days - prudent to use AI for those 2-4 days.

## Table of Hormones required, route of application and example products:

| Code      | Hormone                         | Route         | Example                           |
|-----------|---------------------------------|---------------|-----------------------------------|
| P4 Device | Progesterone releasing device   | Intra uterine | PRID, CIDR                        |
| GnRH      | Gonadotrophin releasing hormone | Intramuscular | Receptal, Overelin, Acegon, Busol |
| PG        | Prostaglandin                   | Intramuscular | Estrumate, Lutalyse, Enzaprost    |
| eCG       | Equine chorionic Gonadotrophin  | Intramuscular | Folligon, Synchronstim.           |

**Products containing the above hormones are prescription only medicines and must be prescribed by your veterinary surgeon**

- The P4 Device needs to be inserted hygienically. Failure to do this will lead to excessive vaginal discharge and reduced conception rates.
- It is advisable to shorten the strings of the PRID/ CIDR particularly in heifers, as a rogue heifer may pull out several devices.
- Always contact your technician/breeding advisor prior to starting any programme to ensure availability of technician(s) on the day for fixed time AI.
- Inadvertent administration of prostaglandin to a cow/ heifer during the first 3-4 months of pregnancy will cause abortion.
- All synchronisation drugs are POM. Always consult with your vet and AI Technician before commencing any programme

## TIMING OF AI CONVENTIONAL VS SEXED

## TIME OF INSEMINATION TO MAXIMISE PERFORMANCE

**Timing for conventional semen** – Cows can be inseminated with conventional semen anytime from the start of standing heat up to 12 hours after the end of standing heat.

**Timing for sexed semen** – Cows can be inseminated with sexed semen from 12-20 hours after the start of standing heat. Heat detection aids and sufficient observation are crucial for accurate and efficient heat detection.

Insemination is a job requiring precision to maximise conception rate. Ensure adequate facilities are available and help the technician especially where more than one animal is to be inseminated.

# **SAFETY FOCUS – PROTECT THE AI TECHNICIAN, THE ANIMAL AND YOURSELF.**

It is the responsibility of all herd owners to make every effort to ensure that anyone working with animals on their farm leaves injury free, having successfully completed their job in a safe and stress-free manner.

## **Prevent animals causing injury**

- Known dangerous animals should always be marked for culling and never presented for insemination.
- Bulling animals are a danger to themselves and the people around them – keep all children and inexperienced animal handlers out of harm's way.
- Make sure that there is an escape route from the collecting yard so anyone can get away from an aggressive animal.
- Never isolate bulling animals – leave them in pairs or small groups for company.

Example – self-locking head gate

Example – Vet gate

**Protect  
your AI  
technician,  
yourself,  
and the  
animals**

## **Safe facilities to avoid injury**

- Ensure the crush is fit for purpose, in good repair and the floor is clean to prevent cows from falling and spilling. A shake of sand on slippery surfaces provides instant grip.
- Stop cows backing on the AI technician – Restrained cows as necessary with a functional head gate or backing bar.
- Prevent cows crushing the AI technician – always use a properly closing back gate or a vet gate at the front of the crush.

Example – anti backing bar

**Good facilities, good job**

## **Biosecurity**

Always have a washing and disinfection point for your AI technician to use when arriving and leaving your farm so they can always remain biosecure.
